

THE CHOLERA IN NEW YORK.

Map Showing the Localities Where the Pestilence First Appeared in 1832.

The above plan of the city has been sketched for the purpose of enabling strangers to perceive the evidence of non-contagion, as well as of local origin, furnished by the prevalence of the epidemic cholera in New York in the summer of 1832.

The heavy black circular lines designate the different parts of the city where the disease suddenly appeared, and in some of them simultaneously. The first cases are reported to have occurred in Cherry street and Roosevelt street, within the circle in the Fourth ward designated on the map by the letter A. But the disease appeared almost simultaneously and with much greater virulence in the Third ward, in Rector, Washington and Duane streets, at the point marked B, which is at least a mile and a half from the point first marked, and also in the Sixth ward, at the corner marked C, which is nearly a mile from the point first marked. Within a few days after, it appeared in the Ninth ward, within the circle marked D, which is nearly two miles from the seats of its first prevalence, and where the epidemic raged with unexampled violence after it had nearly subsided in almost every other part of the city. Very soon afterwards it broke out in the Twelfth ward, at the prison and hospital at Bellevue, marked E, nearly three miles from the place of its commencement; at Yorkville and Harlem, distant four and eight miles from the city; at Laurens street, in the Eighth ward, marked F on the map; at Corlears Hook, in the Seventh ward, which is designated G; in the Eleventh ward, in the neighborhood of First street, east of the Bowery, where a great number of cases suddenly appeared, within the circle marked H; and at the house in Broad street, in the First ward, where there were ten fatal cases, marked I.

THE DISTRICTS WHERE THE CHOLERA RAGED IN 1849.

The above map shows the relative and absolute mortality in the eighteen wards of this city from the cholera in 1849. The figures indicate the number of deaths from the disease, and the dates show the appearance of the first case in each ward.

part, but very far from being in good sanitary condition as they should be, and at the present time are doing much to spread the disease. It is not to be expected that they will be improved before they can be put in a state to receive the cholera, and it is not to be expected that they will be improved before they can be put in a state to receive the cholera, and it is not to be expected that they will be improved before they can be put in a state to receive the cholera.
